ARJA MANISH

Sales Timing & Trends

MY CONTRIBUTION

In this project, I mainly worked on the **sales timing and trends analysis**. My part was to understand when the business was generating more revenue by comparing the weekday and monthly patterns. I focused on identifying the strongest and weakest sales days and months, including the performance of Electronics. One finding that stood out to me was that **Saturday had the highest average daily revenue**, while Tuesday was the lowest. January was the strongest month, while June was the weakest, and Electronics also showed a noticeable decline during this period. I used these findings to provide useful timing signals for the team's analysis and recommendations.

WHAT I LEARNED FROM MY TEAMMATES

I learned something useful from each of my teammates while working on this project. From **Akash**, I understood that cleaning and validating the data is very important before starting any analysis. From **Ashika**, I learned how product-level analysis can provide more detail than simply looking at overall sales patterns. From **Pavithra**, I learned how different findings can be connected to form clear business insights and recommendations. Working together also helped me understand why observed sales patterns should be treated as useful signals rather than direct proof of causation.

KEY TAKEAWAY

This project helped me understand how sales timing and trend analysis can provide useful signals for business planning and decision-making.
