RENDLA PAVITHRA

Lead Presenter

My Contribution

In this project, I mainly worked on the **business insights and final recommendations**. My part was to look at the analysis as a whole and understand what the numbers were actually telling us. I focused on comparing the category performance, especially the change in Electronics and Apparel from January to June. I also connected the product, discount, and sales-day findings so that we could explain the results in a simple business context. One finding that stood out to me was that Electronics contributed the largest share of revenue but still showed a significant decline, while Apparel showed strong growth. I used these findings to prepare the main points and recommendations for our presentation. I also took responsibility for bringing the different sections together and presenting the final conclusion.

What I Learned from My Teammates

I learned something useful from each of my teammates while working on this project. From **Akash**, I understood that cleaning and validating the data is very important before starting any analysis. From **Ashika**, I learned how product-level analysis can give more detail than simply looking at category totals, and I also understood why we should be careful before saying that one factor directly caused another. From **Manish**, I learned how weekday and monthly sales patterns can give additional meaning to the revenue numbers. Working together also helped me become more comfortable explaining data in a simple way instead of just showing charts and numbers. Overall, this project gave me a better understanding of how a team can combine different parts of an analysis and turn them into one clear story for a business audience.

Key takeaway: This project helped me understand how to turn analysis into a clear business story and communicate the findings with confidence.
