Product & Discount Analysis

My Contribution

In this project, I mainly worked on the **product-level and discount analysis**. My part was to look beyond the overall category totals and understand what was happening at the individual product level. I focused on comparing product performance within Electronics and Apparel and also examined how average revenue per transaction changed across different discount levels. In Electronics, **Headphones generated around 47.7 million**, followed by **Laptop at around 46.55 million**, while Smart TV was the lowest-revenue product in our comparison. In Apparel, **Saree generated around 14.16 million** and **T-Shirt around 14.10 million**, making them strong contributors in that category. I also found that average revenue per transaction was about **4,685.65 at 0% discount** and about **3,631.73 at 20% discount**, while average units sold remained almost the same. I used these findings to explain the product and discount patterns in a simple business context.

What I Learned from My Teammates

I learned something useful from each of my teammates while working on this project. From **Akash**, I understood that cleaning and validating the data is very important before starting any analysis. From **Pavithra**, I learned how overall category performance can be connected with product and discount findings to build a clearer business story. From **Manish**, I learned how weekday and monthly sales patterns can give additional meaning to the revenue numbers. Working together also helped me understand why we should be careful before saying that discounts directly caused a revenue change, because other factors such as product mix or promotion targeting may also be involved. Overall, this project helped me become more comfortable explaining detailed analysis in a simple way instead of just showing charts and numbers.

Key takeaway: This project helped me understand how product-level and discount analysis can reveal insights that may not be visible from category totals alone, and how to communicate those findings clearly for a business audience.
